

Installation

Below you can find details on how to install UBuild.

Requirements

- Windows 10.0.17763.0+
- .NET 8.0 Runtime (Download Runtime from [here](#))

Installation

Ensure the above requirements are met before installing. (*Installing .NET may require a restart of your PC*)

1. Download the latest UBuild build from <https://ubuild.publiczeus.com/download>
2. Extract the UBuild folder within the zip to wherever you would like the application to "live". (*this is based on user preference*)

First-time setup

Given that you have downloaded the UBuild tool to its own folder, follow the steps below to complete the "first-time setup" process.

1. *Run UBuild.exe*
 - As UBuild isn't yet a known application Windows may warn you that it has come from an "Unknown Publisher", so long as you have downloaded UBuild from a trusted source (ie: <https://ubuild.publiczeus.com/download>) you simply click "More info" > "Run anyways".
 - *As this is your first time running UBuild, the application will automatically create the necessary folder & files.*
2. You will now be presented with the license agreement, before continuing you must agree that you will not use UBuild for commercial purposes. (*you'll only have to do this once*) (*read [here](#) for more about Commercial Licenses*)
3. Once you have agreed to the license, you're now able to start using UBuild!

From here it's recommended you Create your first Project. (see more [here](#))
